ACCESSING AGKEEPER

Download AgKeeper free from the Apple App Store and sign in with a username and password obtained from your ARMtech insurance agent.

Users with appropriate credentials can access data from anywhere, with or without internet connectivity. The AgKeeper application utilizes the smart device's local database storage coupled with a strong synchronization engine to support ongoing field data access without requiring real-time internet connectivity.

AgKeeper®

WHAT IS AGKEEPER?

ARMtech is committed to providing our partners and customers with innovative tools to improve the accuracy and efficiency of their operations. With that effort in mind, we are proud to offer AgKeeper, a powerful mobile farm management information system, as a free service for our agents and their policyholders.

With the increasing complexity of agribusiness, producers can no longer rely on spreadsheets and notebooks to efficiently track revenue, expenses, and production. AgKeeper can centralize business and operational data for an entire farming operation, allowing producers to make data-driven, strategic decisions to improve risk management, productivity, and profitability.

Compatible with most current iOS mobile devices (not yet available for Android users), the AgKeeper mobile application is designed for use in the field with or without cellular service or Wi-Fi, and has been enhanced to facilitate the explosion in precision agriculture for use in USDA programs. With AgKeeper's wide-ranging functionality, producers can track farm operations from dirt to delivery using digital forms and a workflow tailored to each policyholder.

TACKLING THE PAPER PROBLEM

Historically, both the agriculture and insurance industries have been complex and paper-intensive processes. Filling out forms, acreage reporting, and typing or converting data consumes an enormous amount of time for both farmers and agents.

AgKeeper is the solution to the paper problem. Our app digitizes, optimizes, and streamlines tedious reporting processes, thus minimizing paperwork and allowing producers to dedicate less time to administrative duties and more time to their farms and family. And, since all forms are securely and digitally stored in the AgKeeper app, there is no need to worry about misplacing documents, or organizing and storing paperwork.

WHAT DOES AGKEEPER HAVE TO OFFER?

AgKeeper was developed in partnership with CropTrak, a company with a proven record in approachable design, efficient data collection, and military-grade information security. By combining the abilities and expertise of both ARMtech and CropTrak, we have produced the comprehensive farm management tool agents and farmers have been waiting for. AgKeeper is an effective and versatile system, which provides a wide range of farm management and risk avoidance tools. It also allows for efficient crop reporting with easy and secure documentation of farming practices to satisfy good agricultural practice requirements. Other benefits include the ability to:

- Easily manage your entire operation from anywhere – even offline. Once you regain connection, you can sync your work with the click of a button.

- Eliminate time-consuming keying, handwriting, and data conversion processes. Map and enter data with AgKeeper's easy-to-use, intuitive interface.

- Make the acreage reporting process more efficient. After existing field maps are downloaded, simply enter and import acreage data into ARMtech's mapping system.

- Report, record, track and view production practices, input costs, tasks, verified field boundaries, and other information in real-time.
